

Synth Order Desk

Voice requests.
Real work.
Clear approval.

Tell Synth what you need.
Review the plan.
Let it do the work.

A working order assistant for merch studios and event teams handling last-minute changes.

BUILT BY GEORGE TRUSHEVSKIY

The screenshot displays the Synth Order Desk interface. At the top, a 'YOU' section contains a message: 'Actually, make it 140 shirts. Keep the same budget.' Below this, the 'SYNTH' section provides a detailed proposal: 'For 140 shirts, split shipment fits the September 18 deadline at \$1,630.00, leaving \$170.00 in the budget. Standard arrives too late, and express costs \$1,850.00. Would you like to approve this proposal? Your company instruction is: allow split shipments when they arrive by the deadline and fit the budget'. To the right, a table compares shipping options:

Option	Cost	Status
Standard arrives Sep 21	\$1,550.00	TOO LATE
Express arrives Sep 18	\$1,850.00	OVER BUDGET
Split shipment arrives Sep 18	\$1,630.00	CHOSEN

Below the table, there are links for 'Remembered instructions · 4' and 'Tools & receipts'. A progress bar at the bottom indicates 'Done · 6 steps' with icons for hotdata, HydraDB, modiqo, cognee, RocketRide, and snyk. Metadata at the bottom of the interface states: 'Hotdata: verified snapshot reused, under five minutes old' and 'Options: three fulfillment options checked'.

Actual app capture | Sample quote, real connected workflow

Evidence: fresh app capture, September 11, 2026. Product and cloud receipts are documented in the project repository.

One change should not restart the whole order.

The demo follows a last-minute event-merch request. Inventory, rates and quote totals are sample business data.

01

150 shirts**\$1,750**

Within an \$1,800 budget.
Split shipment meets the
deadline.

02

140 shirts**→ \$1,630**

Change the quantity.
The previous approval is
cleared.

03

Explicit approval**→ Ready to act**

The exact revised plan unlocks
the packet and connected
actions.

Why it helps: stock, deadline, budget, shipment policy and approved outputs stay connected.
The operator does not retype the same change into five tools.

Proposal · 140 black T-shirts

Split shipment · \$1,630.00 · arrives
Sep 18

Budget \$1,800.00, \$170.00 left. Awaiting
your explicit approval: say "approve" to
record it.

Standard	\$1,550.00
arrives Sep 21	TOO LATE

Express	\$1,850.00
arrives Sep 18	OVER BUDGET

Split shipment	\$1,630.00
arrives Sep 18	CHOSEN

► Remembered instructions · 4

Receipts: review150.json, 04-amend140.json and 05-explicit-approval.json from the fresh recorded conversation.

A request becomes checked, approved work.

The language model interprets the request. Business rules and approval checks control the actions.

A changed requirement invalidates approval. A remembered rule changes the next decision.

Example: remember “never split shipments.” A new conversation then rejects the \$1,800 plan; raising the budget to \$2,000 makes the sample \$1,950 express option feasible.

Memory behavior verified in the complete earlier capture; new action footage is captured as an explicit continuation.

Three scoped data workers. One checked decision.

The app creates a separate temporary database for each input domain, then runs the SQL queries in parallel.

Scope enforced

A foreign-catalog query was rejected.

Evidence retained

Database IDs, SQL, rows and timings.

Cleanup verified

Owned databases deleted after the run.

Proof: final-recording-flow audit verifies 2 fresh waves, 6 database deletions and a cross-scope HTTP 400 denial. No LLM fan-out claim.

Every integration has a specific job.

Local reasoning and deterministic checks coordinate real services. Sponsor names are not simulated activity.

Hotdata

Scopes and queries the three input domains.

Cognee

Stores company notes for later conversations.

RocketRide

Runs the cloud Python verdict; gates the plan.

Snyk

Scans code and dependencies; findings stay visible.

HydraDB

Reads deadline and shipment constraints.

Rote / Modiqo

Replays the review and work-packet procedures.

Tenki Cloud

Provides the real browser and saved-work workspace.

Whisper + Apple + Ava

Local speech recognition and intent; neural narration.

APPLICATION TypeScript + Bun / Node | Python / Swift | SQLite event store | static public hub

MEDIA Remotion + Higgsfield editorial visuals | ReportLab PDF | Cloudflare Pages staging

Limits: raw Cognee notes, direct Hydra constraints, deterministic RocketRide Python. GPT Live is blocked on the tested gateway; Ava is labeled.

A real draft, with a clear boundary.

PRINTFUL / PROVIDER-VERIFIED DRAFT

#176055721

One Black / M sample tee

Catalog variant 4017

Official TRU front artwork requested

Unsubmitted. No payment. No shipment.

Artwork processing and print readiness remain unverified. The real sample draft is separate from the fictional 140-shirt quote.

Also verified

GitHub work ticket #2 and the exact approved handoff on Tenki.

Owner email confirmed in Gmail Sent and Inbox.

No external recipient delivery is claimed.

Sources: actual Printful create + GET readback, matching recorded receipt, and GitHub issue #2. Failed attempts and corrections remain retained.

Useful today. Specific work remains.

For merch studios and event teams that need to turn a changing brief into coordinated, approved work.

The next production steps

- 01 Connect live inventory and shipping rates.
- 02 Add per-customer access, credentials and retention.
- 03 Verify print files and human order confirmation.
- 04 Bound sending, monitoring and failure recovery.

Security findings are disclosed: the recent code scan has open findings, and the Event development toolchain has 29 advisories. This is a reviewed demo, not a production-ready release.

Public project hub / deployment pending

trusynth-order-desk.pages.dev

Links are clickable. Recorded demo and final source package are being staged in the project repository; the live workspace is temporary.

Project repository

github.com/gtrush03/synth-order-desk

Live cloud workspace

Temporary: September 11, 4:51 PM PDT.
Saved work and browser proof, not a public Mac.
